Co This invention describes novel isolated human genes and the secreted content of the encoder. The products of the invention are useful for mean profuse and encoder in the encoder of preventing, treating or ameliorating medical conditions, e.g. by protein conferentially the amount of the new polypeptides in a sample or by conferentially the presence of mutations in the new polynucleotides. Based on Specific uses are described for each of the 101 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal contromed diseases, blood disorders, leukemias, diseases of the immune system, autorimmune diseases, hepatic and renal diseases lymphomas, inflammation, allergies, Alzheimer's and cognitive disorders, pulmonary disorders, transplant rejection, disorders involving osteoclasts such as costeoporosis, arthritis or malignancies, diseases, such as contains and products of the invention are represented in X07852-X07993 and the encoding nucleic acids are represented in X37451-X37552.
                                                                                                           New isolated human genes and the secreted polypeptides they encode

It currently consists of 53 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Center: Whitehead Institute/ MIT Center for Genome

It currently consists of 27 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This record contains 183 individual
sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Center code: WIBR

It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 80 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps petween the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    length

Hypertension related calcium regulated gene - useful to develop products to treat or detect, e.g. hypertension, stroke, osteoporosis, heart failure, cancer, diabetes or asthma claim 2; pages 25-26; 46pp; English.

This nucleic acid sequence encodes the hypertension related calcium regulated gene (HoaRN), which was isolated from the rat parathyroid. Its expression is regulated by extracellular calcium concentration. An antibody against the protein, can be used to detect or modulate (e.g. enhance or inhibit) abnormal calcium levels. They can specifically be used to detect or reat, e.g. hypertension, hyperthyroidism, osteoporosis, heart failure, diabetes, stroke, cancer, inflammatory disease, and asthma.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This nucleic acid sequence encodes the hypertension related calcium regulated gene (HCaRG), which was isolated from the human parathyroid. Its expression is regulated by extracellular calcium concentration. The sequence display 75 percent homology to the rat form, with conserved areas such as the EF-hand like motifs and the initiating codon. An antibody against the protein, can be used to detect or modulate (e.g. enhance or inhibit) abnormal calcium levels. They can specifically be used to detect or treat, e.g. hypertension, hyperthyroidism, osteoporosis, heart failure, diabetes, stroke, cancer, inflammatory disease, and asthma.
